Owing to the importance of C-SAC-2120 prep4sure test, it is very difficult to pass C-SAC-2120 test dumps smoothly.

NEW QUESTION: 1
Which three basic security measures are used to harden MSDP? (Choose three.)
A. MSDP SA filters
B. MSDP neighbor limitation
C. loopback interface as MSDP originator-ID
D. MSDP state limitation
E. MSDP MD5 neighbor authentication
Answer: A,D,E
Explanation:
To secure the control plane, we harden MSDP via three basic security measures:
1) MSDP SA Filters
It is a "best common practice" to filter the content of MSDP messages via MSDP SA filters. The main idea of this filter is to avoid propagating multicast state for applications and groups that are not Internet-wide applications and do not need to be forwarded beyond the source domain. Ideally, from a security point of view, the filters should only allow known groups (and potentially senders), and deny any unknown senders and/or groups.
2) MSDP State Limitation
When MSDP is enabled between ASs it is recommended to limit the amount of state that will be built in the router due to "Source-Active" (SA) messages received from neighbors.
3) MSDP MD5 Neighbor Authentication
We support and recommend the use of MD5 password authentication on MSDP peers. This uses the TCP MD5 signature option, equivalent to the use described in RFC 2385 for securing BGP.
